MATH 217 W24 - LINEAR ALGEBRA, Section 001 (Dr. Paul Kessenich)
Homework Set Part B due SUNDAY, April 21 at 11:59pm
Zhengyu James Pan (jzpan@umich.edu)

1. (a) Let E_0 denote the 0-eigenspace of T. Explicitly describe E_0 (as a set).

   Solution:
   $$E_0 = \{(x_1, 0, x_2, 0, x_3, 0, ...) \mid x_i \in \mathbb{R}\}$$

   (b) Prove that every real number λ is an eigenvalue of T. (Hint: explicitly construct an eigenvector $(x_1, x_2, x_3, ...) \in V$. First consider x_i when i is a power of 2.)

   Solution: Let $\lambda \in \mathbb{R}$. Then let

   $$s = (1,\ \lambda, \lambda,\ \lambda^2, \lambda^2, \lambda^2, \lambda^2,\ \lambda^3, \lambda^3, \lambda^3, \lambda^3, \lambda^3, \lambda^3, \lambda^3, \lambda^3,\ ...)$$

   be an infinite sequence such that each consecutive power λ^n is repeated n times in the sequence, starting from $n = 0$. Then

   $$T(s) = (\lambda,\ \lambda^2, \lambda^2,\ \lambda^3, \lambda^3, \lambda^3, \lambda^3,\ \lambda^4, \lambda^4, \lambda^4, \lambda^4, \lambda^4, \lambda^4, \lambda^4, \lambda^4, ...)$$
   $$= \lambda(s).$$

   So any real number is an eigenvalue of T.

2. (a) Let $\mathscr{D}$ be a diagonal $n \times n$ matrix with distinct entries along the diagonal, and let $\mathscr{D}$ be the subset of $\mathbb{R}^{n \times n}$ consisting of all diagonal matrices. Prove $\mathscr{C}(D) = \mathscr{D}$.

   Solution: Let the diagonal entries of D be $d_1, ..., d_n$. Let $A \in \mathscr{D}$, with diagonal entries $a_1, ...a_n$. Then the product

   $$AD = \begin{bmatrix} a_1 d_1 & 0 & \dots & & 0 \\ 0 & a_2 d_2 & 0 & & \vdots \\ \vdots & 0 & \ddots & & 0 \\ 0 & \dots & 0 & & a_n d_n \end{bmatrix} = DA.$$

   So $\mathscr{D} \subset \mathscr{C}$.

   Let $B \in \mathscr{C}(D)$ with columns $\vec{b}_1, ..., \vec{b}_n$, rows $\vec{c}_1, ..., \vec{c}_n$, and element of ith row and

jth column b_{ij}. Then

$$BD = \begin{bmatrix} | & & | \\ B(d_1\vec{e}_1) & \cdots & B(d_n\vec{e}_n) \\ | & & | \end{bmatrix}$$

$$= \begin{bmatrix} | & & | \\ d_1\vec{b}_1 & \cdots & d_n\vec{b}_n \\ | & & | \end{bmatrix}$$

$$DB = \left((DB)^\top\right)^\top$$
$$= \left(B^\top D\right)^\top$$
$$= \begin{bmatrix} | & & | \\ d_1\vec{c}_1^\top & \cdots & d_n\vec{c}_n^\top \\ | & & | \end{bmatrix}^\top$$
$$= \begin{bmatrix} - & d_1\vec{c}_1 & - \\ & \vdots & \\ - & d_n\vec{c}_n & - \end{bmatrix}$$

where $\vec{e}_i$ is the ith standard basis vector. Since $B \in \mathscr{C}(D), BD = DB$. Considering arbitrary b_{ij}: If $i = j$ then d_i
